

REPEATER FOR MOBILE COMMUNICATION SYSTEM RGSM-900

It is intended for increasing of GSM mobile communication service zone in places with a low level.

Repeater's using allows provide a reliable phone communication in places with impossible communication for some reason. To a category of such places are referred so-called, "shadow areas" - basements, hangars, shopping centers, vestibules, or premises with thick walls. The repeater amplifies a signal and allows stabile phone communication reducing risk of its loss or interruption at the lowest signal level.

Advantages:

- decrease of a microwave irradiation of the subscriber at the cost of a power decreasing, demanded for reliable reception;
- increasing of accumulator work duration without recharging of a battery.

At base station direct visibility the repeater installation is simple and does not demand the special equipment.

Delivery complete set:

- transceiver module 1pcs
- antenna as "wave duct" 1pcs
- connecting cables

It is possible manufacturing of antennas with a spectral radiation (reception of three operators is provided) on the customer's request.
